

UBDR GOLD VERSION 5.0

NEW FEATURES:

- **VMDK File Backup.**

UBDR Gold Version 5.0 now has the ability to simultaneously create a VMware ESX or GSX Virtual Machine Disk (VMDK) file when performing an image backup. Concurrently creating an ESX or GSX VMDK file during a Windows image backup **is a first in the industry**. This greatly simplifies a disaster recovery by eliminating the conversion required by a typical physical-to-virtual (P2V) operation. From a competitive standpoint, all other P2V migration and disaster recovery utilities that we are familiar with still require a multiple step process. Some P2V utilities even have conversion limitations that must be observed.

With this release, a UBDR Gold P2V migration or disaster recovery can **take less than three minutes** after the backup completes because no additional processing is required. All VMware disks, partitions, and file types are supported. Thus, UBDR Gold v5.0 eliminates any potential conversion issues because a VMDK file can be universally read as if it were a physical disk within every VMware user environment. In short, this functionality will save customers not only time, but can help to eliminate possible points of failure that could potentially occur when using other utilities to perform vital P2V migrations and/or disaster recoveries.

Another unique feature is the ability to **update an existing VMDK file** with just the system changes, using a **differential or incremental backup**. This means that any incremental or differential backup produces a fully updated VMDK file which can be used immediately for a required P2V operation. With a virtual machine on standby, an administrator would simply need to upload the VMDK file and boot to perform a complete disaster recovery operation.

The new VMDK feature is an additional option for UBDR Gold customers. **For a limited time, VMDK file backup will be included free of charge with all new UBDR Gold license** purchases made from now until December 31, 2009. Active maintenance customers who upgrade from UBDR Gold Version 4.0 to Version 5.0 will also have the VMDK file enabled at no charge until December 31, 2009. Purchase and maintenance pricing for the VMDK option will be available to resellers in September.

ULTRABAC VERSION 9.0

NEW FEATURES:

- **UltraBac Management Console.**
- **VCB Agent.**
- **SharePoint 2007 Support.**
- **SQL 2008 Support.**

UltraBac Version 9.0 continues to provide the same great data protection features and functionality, but has been completely redesigned with a new UltraBac Management Console. We've received requests from you, our resellers, as well as our customers to update the look of our software and we listened. The fresh user interface, based on a tabular format similar to Microsoft's Office 2007, makes the software more intuitive and easier to use than ever. If you like the new look, let us know!

Our **new VMware Consolidated Backup (VCB) Agent** provides VMware users a centralized backup solution for all guest machines – it **does not require software to be installed locally**. Utilizing VMware's snapshot technology ensures that the system is backed up in a clean state. Administrators can select either a FileVM or FullVM backup operation. Users have the ability to choose which virtual machines (VMs) to back up while performing a FullVM. For FileVM backups, users have the granularity to select machines, folders and files. Additionally, FileVM backups can be easily restored either to the original virtual machine or to a local system. In simple terms, the agent provides your customers using VMware with a **centralized solution to easily backup all virtual hosts in one operation**. Of the organizations currently using virtualization, 89% have implemented VMware as their solution (with the ESX platform having the largest install base). With this sizable market share, UltraBac's new VCB Agent can help you compete and win new business within this user community.

When competing for new business within the VMware space, it is worthwhile to mention a multi-functional solution like UltraBac can help lower customer costs. By providing a single vendor solution, our VCB Agent is cost effective by the nature of the technology, particularly when compared to some **dedicated VCB products that are expensive**. The agent also requires no footprint or installation of the product on protected machines thereby reducing the resource burden across all the virtual machines that are active on the host.

The VCB Agent is an additional option to UltraBac. The pricing is €495 EUR per socket. First year maintenance on the product is €130.
